

CLAIM AMENDMENTS

1. (currently amended): An extraction unit ~~device for mating with a carrier~~ comprising:
 a carrier, and;
 an extraction device for mating with the carrier having a first end and a second
 end, comprising;
 a carrier-receiving portion at a the first end; and
 a conduit interconnected to the carrier-receiving portion; the conduit
 extending between a first opening at the carrier-receiving portion and a second opening at
 the second end;
 wherein the carrier receiving portion mates with the carrier, closes the first
 opening, seals the first opening to prevent fluid flow, and forms a reservoir is
 ~~adapted to receive a carrier such that a reservoir is formed.~~
2. (currently amended): The extraction unit ~~device~~ of claim 1 wherein the reservoir
has a volume of approximately 0.01 to 250 μ L.
3. (currently amended): The extraction unit ~~device~~ of claim 1 wherein the second
end is adapted to mate with a vessel such that the vessel is in fluid communication with
the conduit
4. (currently amended): The extraction unit ~~device~~ of claim 1 wherein some non-
specifically transferred material is excluded from the reservoir ~~includes at least a portion~~
~~of the carrier and at least a portion of the conduit.~~
5. (currently amended): The extraction unit ~~device~~ of claim 1 wherein at least a
portion of an extending feature on the carrier is excluded from the reservoir ~~substantially~~
~~sealed at the carrier.~~
6. (original): An extraction device for mating with a carrier comprising:

a carrier-receiving portion at a first end; and
a conduit interconnected to the carrier-receiving portion; the conduit extending between the carrier receiving portion and a second end;
wherein the carrier-receiving portion is adapted to receive a carrier having a transfer film such that the reservoir is formed and at least a portion of the transfer film is disposed within the reservoir.

7. (original): The extraction device of claim 6 wherein the carrier-receiving portion is adapted to receive the carrier such that at least a portion of the transfer film is disposed outside the reservoir.

8. (original): The extraction device of claim 7 wherein the at least a portion of the transfer film disposed outside the reservoir includes at least one stand-off portion.

9. (original): The extraction device of claim 7 wherein at least a portion of the transfer film disposed outside the reservoir includes matter transferred to the transfer film by non-specific transfer microcapture.

10. (original): The extraction device of claim 6 wherein the at least a portion of the transfer film disposed within the reservoir includes matter transferred to the transfer film by specific transfer microcapture.

11. (currently amended): An extraction device for mating with a carrier comprising:
a carrier-receiving portion at a first end; and
a conduit interconnected to the carrier-receiving portion;
wherein the carrier-receiving portion is adapted to receive a carrier to form a reservoir and further adapted to selectively cover at least a portion of the carrier-, and
wherein the at least a portion of the carrier includes an extending feature, and at least a portion of the extending feature is sealed from the reservoir.

12. (currently amended): The extraction device of claim 11 wherein non-specifically transferred material is on the portion of the extending feature sealed from the reservoir
~~the at least a portion of the carrier includes a stand-off portion.~~

13. (currently amended): The extraction device of claims 11 or 12 wherein the extending feature comprises one or more stand-offs or spacers ~~at least a portion of the carrier is sealed from the reservoir.~~

Claims 14-78 (canceled)

79. (currently amended): A method for extracting matter on a carrier comprising the steps of:

- providing a carrier having a transfer film;
- transferring matter to the transfer film;
- providing an extraction device with a conduit having a first opening and a second opening;
- matting the carrier to the extraction device to close the first opening;
- forming a reservoir with the transfer film;
- providing fluid to the reservoir via the second opening in the conduit to extract matter from the transfer film; and
- removing the fluid from the reservoir.

80. (original): The method of claim 79 wherein the step of transferring matter to the transfer film includes transferring matter to the transfer film by specific transfer microcapture; and

further including the step of disposing matter that is adhered to the transfer film by specific transfer microcapture within the reservoir.

81. (original): The method of claim 79 wherein the step of transferring matter to the transfer film includes transferring matter to the transfer film by non-specific transfer microcapture; and

further including the step of substantially excluding matter that is adhered to the transfer film by non-specific transfer microcapture from the reservoir.

82. (original) The method of claim 79 wherein the step of providing a carrier having a transfer film includes providing a carrier with at least one stand-off portion; and further including the step of covering the at least one stand-off portion.

Claims 83-92 (canceled)

93. (new): An extraction unit comprising:
a carrier having a bottom surface; and
a device adapted for mating with the carrier, the device having;
a carrier-receiving portion at a first end; and
a conduit interconnected to the carrier-receiving portion;
wherein the device mates with the carrier at the carrier-receiving portion to form a reservoir and wherein the device excludes at least a portion of the bottom surface of the carrier from the reservoir.

94. (new): The extraction unit of claim 93 wherein the bottom surface of the carrier has extending features and the extending features are excluded from the reservoir.

95. (new): The extraction unit of claim 94 wherein the extending features comprise one or more stand-offs or spacers.

96. (new): The extraction unit of claim 93 wherein the bottom surface of the carrier has a transfer film and at least a portion of the transfer film is excluded from the reservoir.

97. (new): The extraction unit of claim 93 wherein the bottom surface of the carrier has a non-specifically transferred material and at least a portion of the non-specifically transferred material is excluded from the reservoir.

98. (new): The extraction unit of claim 93 wherein the extraction device has a second end, the second end being adapted to mate with a vessel such that the vessel is in fluid communication with to the reservoir.
99. (new): The extraction unit of claim 98 wherein the vessel is a centrifuge tube or a microtiter plate.
100. (new): An extraction unit comprising:
a carrier having a bottom surface; and
a device adapted for mating with the carrier, the device having;
a carrier-receiving portion at a first end; and
a conduit interconnected to the carrier-receiving portion;
wherein the device mates with the carrier at the carrier-receiving portion to form a reservoir and wherein the device covers at least a portion of the bottom surface of the carrier from the reservoir.
101. (new): The extraction unit of claim 100 wherein the bottom surface of the carrier has extending features and the device covers the extending features.
102. (new): The extraction unit of claim 101 wherein the extending features comprise one or more stand-offs or spacers.
103. (new): The extraction unit of claim 100 wherein the bottom surface of the carrier has a transfer film and the device covers at least a portion of the transfer film.
104. (new): The extraction unit of claim 100 wherein the bottom surface of the carrier has a non-specifically transferred material and the device covers at least a portion of the non-specifically transferred material.

105. (new): The extraction device of claim 5 wherein the extending features comprise one or more stand-offs or a spacers.

106. (new): A method for extracting matter on a carrier comprising the steps of:
providing a carrier having a transfer film;
transferring matter to the transfer film;
providing an extraction device with a first end and a second end and a conduit extending between the first and second end, the conduit having a first opening at the first end and a second opening at the second end;
mating the carrier to the first end of the extraction device to close the first opening of the conduit to form a reservoir that contains at least a portion of the transfer film;
providing fluid to the reservoir through the second opening to extract matter from the transfer film;
mating a vessel to the second end of the extraction device; and
transferring the fluid from the extraction device into the vessel through the second opening.

107. The method of claim 106 wherein the step of transferring the fluid from the extraction vessel uses centrifugation.

108. The method of claim 106 wherein the step of transferring the fluid from the extraction vessel is performed without separating the carrier or the vessel from the extraction device.
